Report : case image_new.jpg

1- Load Image

It happens to load the image with the roots and the leaves appear well

problem:
 Why at first the image is in black and white but in color at the output of the load?

Note :

After just loading, the detection of the petri dish was not done well and that to cause the blocking of the segmentation and all the rest.

Problem: For this image case, we must review the code from the detection stage to the end.
